

FRANK J. DOYLE TRANSFORMER SALVAGE SITE: ERB investigated this site in Leonard, Fannin County, Texas on June 29, 1995. This site was originally investigated by ERB based on a citizen's complaint in September of 1990. At that time, ERB determined that there was no IS&E based on low levels of PCBs detected on-site and off-site, and referred the case back to TSCA. On May 23-24, 1995, Worldwide Reclamation, a contractor for Mr. Doyle, conducted sampling at the site. Sample results revealed extremely high concentrations of PCBs off-site (i.e. 2,730ppm in one location), as well as high levels of PCBs in the north side of the facility (i.e. 25.5ppm to 1,590ppm). As a result, TSCA referred the case back to ERB on June 28, 1995. Our investigation of the site revealed the existence of a new day care facility adjacent to the site. Since children are primary targets for exposure to contaminated soil, ERB will seek access to sample the day care facility and work to control the source of pollution.
